
Social Media

OVERVIEW

Create a social media app using laravel framework. No frontend frameworks needed.

DATABASES

users: id (primary key),

name,

email,

password

posts: id (primary key),

user_id (foreign key),

title (string)

body (string

comments: id (primary key),

post_id (foreign key),

text

SPECIFICATIONS

Implement user functionalities.

- Sign Up New Account
- Login

Implement post functionalities for each user, each user can create a new post and everyone can see them on the main dashboard.

- Create a new post (the post must belong to the user.)
- Edit a post (users can only edit their own posts. Use authorizations to guard to protect others from editing someone else's posts.)
- Delete a post (same as above, users can only delete their own posts)

Implement comment functionalities for each post, every user can comment on every post belongs to everyone.

- Create a new comment (the comment must belong to a post.)
- Edit a comment (users can only edit their own comments. Use authorizations to guard to protect others from editing someone else's comments.)
- Delete a comment **(this one might be a little bit tricky, each user can delete their own comments under any posts, but the post owner can also delete any comments under their post.)**

Implement the news feed page where the logged in user can see everyone else's posts. Add a link to open a separate detail page for each post and implement comments functionality on that page. (the user can create comments on the detail page of the post.)

- Create the news feed page.
- Create the details page with a list of everyone else's comments and a form to add new comments.
